

Genome editing in crops: new tools in an old toolbox

Agustin ZSÖGÖN

Departamento de Biologia Vegetal Universidade Federal de Viçosa, MG Brazil

Introduction

- Food security: Breeding challenges for the next decades **New tools:**

1- Ideotype breeding of crop varieties

- The ideotype and model-based breeding
- Case study: Enhancing autogamy and fruit yield

2- De novo domestication of wild species

- A novel approach to explore natural genetic variation
- Case study: domestication of a tomato wild relative

Perspectives

Introduction

Food security: Breeding challenges for the next decades
New tools:

1- Ideotype breeding of crop varieties

- The ideotype and model-based breeding
- Case study: Enhancing autogamy and fruit yield

2- De novo domestication of wild species

- A novel approach to explore natural genetic variation
- Case study: domestication of a tomato wild relative

Perspectives

Introduction

Food security: all people, at all times, have physical, social, and economic access to sufficient, safe, and nutritious **food** that meets their **food** preferences and dietary needs for an active and healthy life.

(UN Committee on World Food Security, 2017)

1-Population growth

200,000 new people every day (need to be fed)

2- Change in climate

Losses in the US are caused mainly by abiotic stresses

3-Nutritional losses: past

Original Research

Changes in USDA Food Composition Data for 43 Garden Crops, 1950 to 1999 Davis et al. (2004) J. Am. Coll. Nutr. 23: 669-682

Donald R. Davis, PhD, FACN, Melvin D. Epp, PhD and Hugh D. Riordan, MD

- Nutritional content in horticultural crops has been decreasing
- Biofortification (cereals, legumes)
 www.harvestplus.org

3- Nutritional losses: future (the "Loladze Effect")

Loladze (2014) eLife doi:10.7554/eLife.02245

Challenges and goals for food security in the coming decades Challenge Goal 1- Population growth Increased yield Resilience 2- Climate change

3- Nutritional losses

Nutritional quality

Challenges and goals for food security in the coming decades

How can we deploy the revolutionary geneediting technology to improve crops on a faster timescale?

Introduction

Food security: Breeding challenges for the next decades
 New tools:

- **1- Ideotype breeding of crop varieties**
- The ideotype and model-based breeding
- Case study: Enhancing autogamy and fruit yield

2- De novo domestication of wild species

- A novel approach to explore natural genetic variation
- Case study: domestication of a tomato wild relative

Perspectives

Ideotype breeding

Euphytica 17 (1968): 385-403

THE BREEDING OF CROP IDEOTYPES

C. M. DONALD

Waite Agricultural Research Institute, The University of Adelaide, South Australia

Breeding:

- (1) Defect elimination
- (2) Increased yield

Ideotype breeding

A philosophy for breeding based on the use of models

The **ideotype**: a plant that in a given environment is

- (i) Theoretically capable of greater production
- (ii) <u>Designed</u> to be bred from the material available (*reverse breeding*)

Introduction

Food security: Breeding challenges for the next decades
 New tools:

- **1- Ideotype breeding of crop varieties**
- The ideotype and model-based breeding
- Case study: Enhancing autogamy and fruit yield

2- De novo domestication of wild species

- A novel approach to explore natural genetic variation
- Case study: domestication of a tomato wild relative

Perspectives

Capsicum (pepper) species are frequently allogamous

Naves et al (2019) TIPS 24:109-120

C. frutescens

C. pubescens

C. annuum

- Low fruit set and reduced yield
- Difficulties to produce pure seed (outcrossing)

C. frutescens

C. pubescens

C. annuum

- Low fruit set and reduced
- Difficulties to produce

In tomato, full autogamy is a key domestication trait

Style2.1 gene

(1) Style length is reduced in cultivated tomato

(2) The responsible gene has
been identified – a change in
the promoter region alters
expression levels

Chen et al. (2007) Science 318: 643-645

Two CRISPR/Cas9 constructs targeting CaSTYLE2.1

- Promoter and coding region of the gene
- Ensure maximal phenotypic variation to discover trait of interest

Genome editing as a tool to achieve the crop ideotype and *de novo* domestication of wild relatives: Case study in tomato

Agustin Zsögön^{a,1}, Tomas Cermak^{b,1}, Dan Voytas^b, Lázaro Eustáquio Pereira Peres^{c,*}

Introduction

- Food security: Breeding challenges for the next decades **New tools:**

- 1- Ideotype breeding of crop varieties
- The ideotype and model-based breeding
- Case study: Enhancing autogamy and fruit yield

2- De novo domestication of wild species

- A novel approach to explore natural genetic variation
- Case study: domestication of a tomato wild relative

Perspectives

Multiplex targeting of domestication genes in *S. pimpinellifolium* in one generation

- Growth habit (determinate)
- Flower number (+600%)
- Fruit size (+300%)
- Fruit shape (ovate)
- Lycopene content (+500%)

De novo domestication of wild tomato using genome editing

Agustin Zsögön, Tomáš Čermák, Emmanuel Rezende Naves, Marcela Morato Notini, Kai H Edel, Stefan Weinl, Luciano Freschi, Daniel F Voytas, Jörg Kudla [™] & Lázaro Eustáquio Pereira Peres [™]

Nature Biotechnology 36, 1211-1216 (2018)

This Altmetric score means that the article is:

- in the 99th percentile (ranked 337th) of the 263,314 tracked articles of a similar age in all journals
- in the 95th percentile (ranked 2nd) of the 47 tracked articles of a similar age in *Nature Biotechnology*

EDITORIAL · 02 OCTOBER 2018

Super-tomato shows what plant scientists can do

A better-tasting tomato highlights problems with Europe's outdated approach to gene editing.

Introduction

- Food security: Breeding challenges for the next decades **New tools:**

1- Ideotype breeding of crop varieties

- The ideotype and model-based breeding
- Case study: Enhancing autogamy and fruit yield

2- De novo domestication of wild species

- A novel approach to explore natural genetic variation
- Case study: domestication of a tomato wild relative

Perspectives

Convergent crop domestication facilitates gene discovery

Lenser & Theissen (2013) TIPS 18: 704-714

Convergent crop domestication facilitates gene discovery

- Use of closely related model species
- Genes in 'simple' pathways or with reduced pleiotropic effects
- Bioinformatics to find homologous genes or equivalent nodal positions

Convergent crop domestication facilitates gene discovery

Introduction

- Food security: Breeding challenges for the next decades **New tools:**

1- Ideotype breeding of crop varieties

- The ideotype and model-based breeding
- Case study: Enhancing autogamy and fruit yield

2- De novo domestication of wild species

- A novel approach to explore natural genetic variation
- Case study: domestication of a tomato wild relative

Perspectives

- 1- Ideotype breeding and *de novo* domestication are conceptually different to conventional breeding
- 2- They help avoid founder effect, linkage drag and reduced recombination rates
- 3- They could provide a fast pathway for increased resilience and nutritional content in crops
- 4- Both require a deeper understanding of the genes underlying key agronomic traits
